

Product & Technology Intern — Screening Assignment

Brief: Practo for Animals

We are exploring a digital platform for the animal-care ecosystem in India, broadly inspired by the convenience of platforms such as Practo.

Today, pet parents and animal rescuers often struggle to find the right vet, clinic, ambulance, NGO, rescuer, boarding facility or other animal-care service. Information is fragmented across Google, Instagram, WhatsApp and word of mouth.

The broad idea is to create a searchable, location-based platform that makes it easier to discover relevant animal-care services and eventually provides technology-driven tools around an animal's healthcare journey.

We are particularly interested in how AI can help organise information, understand medical documents/reports and reduce manual work.

The above is intentionally a high-level description. Further product and business details will be shared with shortlisted candidates.

Your Assignment

Imagine you have joined us as a Product & Technology Intern. Based only on the brief above, show us how you would approach turning this idea into an MVP.

1. Your Product Concept

- Who would use the platform?
- What problem would you solve first?
- What 5 features would you prioritise?

2. User Flow & Prototype

Create a basic user flow and 2–4 screens/clickable prototype showing how you imagine the product working. You may use Figma, Replit, Lovable, Bolt, Cursor, Claude, ChatGPT, Gemini or any other tools.

3. AI & Automation

Show us where you would use AI. We are particularly interested in creative applications of AI to animal-care information and medical records.

- 2–4 AI-powered workflows
- What data/information the AI would process
- What you would automate
- Which parts of your solution are your own ideas/concepts

4. Technology

Briefly suggest the technology approach you would take.

- Your preferred technology stack
- 3–5 APIs/integrations you would consider
- How the main components would connect

5. MVP Thinking

If you had 30 days to build and test the first version, what would you build first and what would you deliberately leave out?

Submission

- Prototype/link

- Maximum 2-page explanation
- Tools and AI platforms used

Expected time: 2–3 hours.

This is a conceptual screening exercise. No production development or commercial work is expected.

Confidentiality

The information shared during the recruitment process is confidential and should not be copied, distributed, published or used outside the recruitment process. Detailed product, business and technical information will only be shared with shortlisted candidates where required.
