

Practo for Animals — Product & Technology Concept

Product & Technology Intern Screening Assignment | Submitted by Aman Sheikh

01 Product Concept

Who: pet parents in urban India (primary); street-animal rescuers and feeders (secondary); vets, clinics, ambulances, NGOs and boarding facilities as the supply side.

First problem: in a crisis — an injured stray, a sick pet after hours — there is no reliable way to find a nearby, *verified* vet, ambulance or rescuer. Information is scattered across Google, Instagram and WhatsApp groups. Discovery-in-a-crisis is the highest-intent, most frequent pain point, so it comes before routine browsing or booking.

Five MVP features:

1. **Location-based directory** of vets, ambulances, NGOs, rescuers and boarding facilities, filterable by distance and open-now status.
2. **Verified provider profiles** — timings, services offered, one-tap call/WhatsApp.
3. **Emergency SOS mode** — nearest 24×7 vet, ambulance or rescuer, ranked by ETA and verification, not ads.
4. **Pet health profile** — basic pet details plus vaccination and visit history.
5. **AI document upload** — a photo of a prescription or report becomes a structured timeline entry with reminders.

02 User Flow & Prototype

Home/Search → Results → Provider Profile → Call/WhatsApp, with a parallel emergency path: Home → SOS → Ranked nearby help → Call.

Prototype: 7 working, clickable screens (Home, Search, Provider Profile, Emergency SOS, Pet Health Timeline, AI Document Upload, AI Symptom Triage) — <https://pawzz-care.vercel.app> (placeholder — final link added on deployment).

03 AI & Automation

Workflow	Processes	Automates
Medical-document extraction	Photo of a prescription, vaccination card or lab report	Manually re-typing medical history into a record
Symptom triage & routing	Free-text symptom description + species/age	Deciding urgent vs. routine and choosing where to route
Directory enrichment	Unstructured listings from Google, Instagram, WhatsApp	Structuring, de-duplicating and flagging bad entries
Rescue-story copy assistant	A rescuer's raw notes and photos	Drafting a publishable rescue story or fundraiser post

Own ideas: the emergency-first framing, ranking SOS results by ETA + verification (never ads), and using document-extraction to build a longitudinal pet health record are original to this concept. The base “searchable directory” pattern is inspired by Practo/JustDial-style platforms, as named in the brief.

04 Technology

Stack: Next.js (mobile-responsive web) on Vercel; Supabase (Postgres + PostGIS, auth, file storage); Claude API for document extraction and triage chat.

Integrations: Google Maps/Places (location, geocoding) • WhatsApp Business API (contact, reminders) • Claude API (vision + text) • Razorpay (donations) • Firebase Cloud Messaging (push reminders).

Connections: Client → API layer → Postgres/PostGIS (providers, pets, records) + object storage (uploaded documents). The AI layer sits beside the API for extraction/triage; Maps, WhatsApp and Razorpay are called from the API layer as needed.

05 MVP Thinking — 30 Days

Build

Directory + geo-search, provider profiles, SOS flow, manual pet profile, and the AI document-upload feature — launched Gurgaon-only with 30–50 manually onboarded, verified listings.

Leave out

Booking & payments, native mobile apps, self-serve provider onboarding, reviews/ratings, AI chat triage (needs tuning), multi-city expansion.

Tools & AI platforms used: Claude (Claude Code) for product thinking, the working prototype, this document, and the extended web write-up.

Extended documentation: <https://pawzz-care.vercel.app/case-study.html> (placeholder — final link added on deployment).
